

代码片段

```
using namespace tbb;  
typedef concurrent_hash_map<int, string> CHM_t;  
CHM_t::accessor o;  
CHM_t::const_accessor t;  
hashmap.insert(o,200);  
hashmap[o] = "here";  
hashmap.find(t,200);
```

用户意见

Why is my program freezing if I use “read only” `const_accessors`? It seems to be locking up, from the API description it seems to be OK to have one `accessors` and multiple `const_accessors`, (writer, reader).
